PROFILE

Software engineer focused on building secure, scalable services with Go, MySQL, Redis, and API development. Works across microservices, performance tuning, and data handling to support reliable delivery, clean system design, and cross-functional collaboration on product and engineering goals.

EXPERIENCE

Software Engineer 03/2026 – Current
Axon
Records Management System
- Helped build Axon cloud services to simplify evidence management and support public safety workflows.
- Built secure, high-volume APIs for complex case files while supporting data privacy, integrity, and compliance across public safety platforms.
- Built and scaled backend microservices for Axon investigation and case management systems, helping streamline digital evidence workflows for law enforcement agencies.
- Reviewed user requirements to shape software solutions and draft technical specs. Worked with product managers and engineers to align sprint planning and support technical decisions.

Software Engineer Contractor 08/2025 – 12/2025
Axon
Project: RIPA Stop Form
- Building a RIPA Stop Form system for law enforcement, enabling structured data capture, validation and verification (V&V), batch submissions to the State Department Of Justice, analytics support, and secure data retention after submission.
- Tech stack: Go, Typescript, C#, MySQL
- Developed form structure and rule-based validation, improving data integrity for law enforcement submissions.
- Designed secure data storage and retention mechanisms, ensuring compliance with regulatory policies.
- Improved desktop and mobile app UI/UX for RIPA form, enhancing user engagement and submission accuracy.
- Contributed to workflows through standups, planning, and code reviews.

Backend Developer 06/2024 – 06/2025
Smilegate Vietnam
Project: StoveLink
- StoveLink is a PC-to-mobile game streaming platform that allows users to seamlessly stream and play PC games on their mobile devices, offering low-latency performance and cloud-native scalability.
- Tech stack: Go, Java, Mux, MySQL, Redis, AWS, OCI, C, Spring Boot, MongoDB
- Developed and maintained core backend services in Go, enhancing performance and scalability for game streaming.
- Engineered custom load balancing and a fault-tolerant Redis Cluster, optimizing data access for low-latency performance.
- Integrated gRPC for fast microservice communication.
- Created Spring Boot services for gameplay notifications and dynamic game list management, improving user experience.
- Implemented real-time game remote control from mobile to PC.
- Enhanced forked open-source tools (coturn for TURN/STUN, Prometheus C client for observability).

Software Engineer 08/2021 – 06/2024
Data Nest
Project: Scoring and Lead Generator

- Built SMS anti-spam filters with Go and Redis for secure messaging. Developed SMS redirection and reminder services.
- Facilitated onboarding integrations with financial and telecom partners to streamline collaboration.
- Maintained scalable microservices with clean code practices.

Project: Secure file transfer tool

- Created web tool for local file encryption and decryption before upload or download to improve data privacy during transfer.
- Tech stack: Go, Gin, Next.js, HDFS. Designed backend API for file encryption, decryption, and file upload handling.
- Built frontend interface for file selection and secure operations. Integrated encryption logic and client-server file handling.

Project: Tinvay

- Built platform that collects loan applications, enriches customer data through scoring and identity verification services, and forwards completed profiles to banks and financial institutions.
- Tech stack: Go, Gin, PostgreSQL, Redis, TypeScript.
- Developed backend services for processing and forwarding enriched loan data. Integrated external services for data enrichment and customer verification, enhancing data accuracy.
- Worked with other teams to maintain data accuracy, reliability, and performance under load.
- Built service for tracking user behavior to support Tinvay analyst team with Go and Kafka. Conducted code reviews and contributed to architectural decisions, ensuring alignment with best practices.

Project: Finzone

- Built personal finance platform that helps users discover, compare, and access financial services.
- Tech stack: Go, Gin, MySQL, Redis, TypeScript
- Developed scalable backend APIs for product listings, lead submissions, and anti-spam features.
- Implemented filtering and recommendation logic to match users with relevant offers. Created admin and internal APIs for content and product management.
- Supported stability through logging, error handling, monitoring, and CI/CD integration.
- Worked with cross-functional teams to align technical delivery with product goals. DevOps work: Managed CI/CD with GitHub Actions.
- Monitored services with Prometheus, Grafana, and Loki, including code-based dashboards and alerts.
- Collaborated with cross-functional teams to ensure technology met product goals.

Software Engineer - DevOps Intern 08/2020 – 08/2021

Data Nest

Project: Scoring and Lead Generator

- Automatically identifies high-potential users. Sends personalized loan offer SMS messages to qualified leads. Upon OTP validation, customers grant consent for banks and financial institutions to access their data securely and competently.
- Tech stack: Go, gRPC, MySQL, Redis, ClickHouse, Kafka, Docker
- Created repository for Grafana dashboard panels and alerts for backup as code, utilizing Jsonnet and Grafonnet to streamline monitoring processes.
- Developed and maintained Go-based microservices and internal tools using the Gin framework to support scalability and performance.
- Ensured code quality, scalability, and consistency across services. Conducted code reviews and promoted best practices within the team.
- Enhanced customer credit scoring system to improve accuracy and reliability in financial service assessments.
- Calculated creditworthiness and fraud scores for individuals using custom-built scoring models.
- Builds dynamic profiles for each user to evaluate lending potential. Profiles are tailored to financial institutions' lending criteria.

EDUCATION

Computer Engineering 09/2022
VNU University of Engineering And Technology (VNU-UET)
GPA: 3.29

SKILLS

- Go
- MySQL
- Redis
- Docker
- Python
- API development
- PostgreSQL
- Kafka
- Git
